YOUR RESPONSE · words, drawing, signing or wanted help

ORIGINAL FICTIONAL SOURCE: Whole A is one fictional display plan with 10 equal-width sections at a common height. 6 sections are finished. Whole B is a separate strip of the same height, twice as wide as A, also divided into 10 equal sections. A draft says "a finished section of A and one section of B have the same area because both have the same fraction name". No actual making or reader trial occurred.

1. What unit fraction of whole A is one section, and what multiple of A is finished?

2. How much more of A completes it? Give a same-denominator relation.

3. Does the draft about section areas follow? Explain using the two wholes.

4. Give one useful revised label for A and one way to check it, without claiming an actual trial.
